In classical time-series analysis, there are two branches of prediction theory. In the problem of pure prediction, the object is to forecast the value of a time series for several steps ahead on the basis of the observed history of the series. The statistical theory of Wiener and Kolmogorov is restricted to stationary stochastic processes.

For three or more time series one can perform a pairwise analysis and thus reduce the problem to a bivariate problem. This approach has some inherent limitations. For example, for the two coupling schemes in Fig. 17.1, a pairwise analysis will give the same patterns of connectivity like that in Fig.

**6.4. Introduction to Time Series Analysis**

Time series analysis is a statistical technique that deals with time series data, or trend analysis. Time series data means that data is in a series of particular time periods or intervals. The data is considered in three types: Time series data: A set of observations on the values that a variable takes at different times.
