Errata for Instructor's Solutions Manual for. Eq (2.1) gives the approximate size of the effect of the Earth where $R_{\oplus} = 6378 \text{ km}$ is the radius of the Earth. However for Sun the relevant radius is the distance of the triangle from the center of the Sun, which approximately the size of the Earth's orbit $r_{\oplus} \approx 1.4 \times 10^8 \text{ km}$.

I've started learning GR from Hartle's "Gravity: An Introduction ...". It's all going well, but I feel I could benefit from solutions to some of the key problems. I assume Hartle hasn't published a companion solution guide. A few options show up on line. One by Jorge Ramos, for example. Besides, as ...

An introductory, undergraduate text in general relativity at the junior senior level. The development follows a physics first approach. The simplest physically relevant solutions of the Einstein equation are presented first, without derivation, to be explored and applied to realistic astrophysical situations like black holes, gravitational radiation, and the beginning of the universe.

gravity is a universal force coupling to all forms of mass and energy. Second, gravity is a long-range force in contrast to the weak and strong forces which are characterized by nucleus-size ranges and below. Third, and most importantly, gravity is unscreened. There is no negative "gravitational charge"; mass is always positive.
