Lab #16 - Properties of Buffer Solutions. The degree to which a weak acid is ionized in aqueous solution is governed by the equilibrium constant K_a for its reversible dissociation reaction (Equation 2 & 3). The equilibrium constant K_a is also referred to as the dissociation constant of the weak acid. The K_a value for acetic acid, for example, is 1.76×10^{-5} .

It is used to represent the strength of the weak acid in the buffer solution. Because Good buffers are widely used in biological research, and since neutral or near-neutral conditions are required for most biological reactions to take place, the pK_a of the weak acid used in a Good buffer is in the range corresponding to a pH range of 6 to 8.

Two equivalent forms of the equation are: In this experiment you will prepare a buffer and measure its pH with a pH-meter. The weak acid of the buffer will be acetic acid ($\text{HC}_2\text{H}_3\text{O}_2$) and its conjugate base, the acetate ion ($\text{C}_2\text{H}_3\text{O}_2^-$). The buffer solution will be prepared using both methods described above.

"Universal" buffer mixtures. Citric acid is a useful component of a buffer mixture because it has three pK_a values, separated by less than two. The buffer range can be extended by adding other buffering agents. The following mixtures (McIlvaine's buffer solutions) have a buffer range of pH 3 to 8.

- [Voiceover] Buffer solutions resist changes in pH and so let's think about a solution of a weak acid and its conjugate base. So here we have HA which is our generic weak acid and so the conjugate base would be A^- . A buffer solution needs to have substantial amounts of both present and that's what ...

Buffer solutions are used as a means of keeping pH at a nearly constant value in a wide variety of chemical applications. For example, blood in the human body is a buffer solution. Buffer solutions are resistant to pH change because of the presence of an equilibrium between the acid (HA) and its conjugate base (A^-).
