Linear algebra moves steadily to n vectors in m -dimensional space. We still want combinations of
the columns (in the column space). We still get m equations to produce b (one for each row). Those
equations may or may not have a solution. They always have a least-squares solution. The interplay
of columns and rows is the heart of linear algebra.

Linear Algebra and Its Applications (Fourth Edition)

Solutionsto Exercises 15 32 A is singular when its third column w is a combination $cu + dv$ of the
first columns. A typical column picture has b outside the plane of u, v, w . A typical row picture has
the intersection line of two planes parallel to the third plane.

As pointed out in the preface of Gilbert Strang's Introduction to Linear Algebra, the speed of every new supercomputer is tested on the matrix equation $Ax = b$. (In case you're interested, the world speed record of 10^{15} operations per second was set in 2008 by teams at IBM and Los Alamos.)
